30        data: docUsers,
31      });
32    }
```

Objective

The primary objective of the Doctor Appointment Booking System is to provide a simple, secure, and user-friendly platform for managing doctor appointments. The system helps patients find suitable doctors, schedule appointments, receive confirmations, and manage their bookings while enabling doctors and administrators to efficiently organize schedules and patient records.

System Overview

The system consists of three main modules:

- **Patient Module:** Patients can register, log in, search for doctors, book appointments, view appointment history, and cancel bookings if necessary.
- **Doctor Module:** Doctors can manage their profiles, set available time slots, view booked appointments, and update appointment status.
- **Admin Module:** The administrator manages doctors, patients, appointments, and monitors the overall functioning of the system.

Working of the System

1. A patient creates an account and logs into the application.
2. The patient searches for doctors based on specialization or department.
3. The system displays the list of available doctors along with their details and available time slots.
4. The patient selects a preferred doctor and books an appointment.
5. The appointment details are stored in the database.
6. The doctor can view the booked appointments from their dashboard.
7. The administrator monitors all users and appointments to ensure smooth operation.

Features

- User Registration and Login
- Doctor Registration and Profile Management
- Search Doctors by Specialization
- Online Appointment Booking
- Appointment Confirmation
- Appointment Cancellation
- Patient Dashboard
